

# HimShakti Food Shelf Life Prediction System

## Week 6 — Authentication & Security Deliverables

**Intern ID:**  
26100547

**Submission Scope:** Deliverable 2 (Auth Flow Test Screenshots)

**Date:** July 12, 2026

### 1. Route Guard Redirect

Attempting to access the protected dashboard route (/dashboard) while unauthenticated automatically triggers the frontend Route Guard, redirecting the user back to the secure /login page.

## 2. Registration Form

The secure user registration interface. Usernames, emails, and passwords are required, with input validation applied to guarantee credential strength and format correctness before sending requests to the backend.

The screenshot displays the registration interface for the HimShakti Shelf Life Predictor. The header includes the logo, navigation links, and a login button. The main content area is split into a welcome message on the left and a registration form on the right. The form includes a Google sign-in option, a link to sign in with an existing account, and input fields for username, email, and password. A 'Create Account' button is at the bottom of the form.

### 3. Registration Success

Successful registration of the account. The password is safely hashed using bcrypt (10-12 rounds) on the server, and the database stores the user credentials securely, redirecting them to the login flow.

## 4. Login Form

The portal authentication form. Accepts the registered email and password to request a secure session token.

The screenshot displays the login interface for the HimShakti Shelf Life Predictor. The top navigation bar includes the logo, the text 'HimShakti SHELF LIFE PREDICTOR', and links for 'Home', 'About', 'Login', and a moon icon. A 'SECURE STAFF PORTAL' badge is visible on the left. The main content area is split: the left side features a large 'Welcome to the Future of Food' heading and a description of the AI dashboard's capabilities; the right side is titled 'Access Portal' and contains the login form. The form includes a 'Sign in with Google' button, a 'Register here' link for new users, an email input field with the placeholder 'Email' and the value 'bhavya@gmail.com', a password input field with the placeholder 'Password' and a 'Show' toggle, and a final 'Sign In' button. The footer contains the logo, 'QUICK LINKS', and 'ABOUT THIS PROJECT'.

**HimShakti** QUICK LINKS ABOUT THIS PROJECT

## 5. Login Success & JWT Token

On successful login, the backend returns a signed JSON Web Token (JWT) signed with the server's private secret. The token is securely stored on the client side in `localStorage` for authorization headers in subsequent API calls.

## 6. Rate Limiting (HTTP 429 Too Many Requests)

Security rate limiter in action. Making more than 5 authentication attempts within a 15-minute window returns an HTTP 429 status code with a user-friendly error message block, protecting the system against brute-force attacks.

## 7. OAuth Consent & Account Selection

The secure Google OAuth flow. When clicking "Sign in with Google", users are prompted with the Google Account Selector and consent screens (either One-Tap card or Chrome account chooser popup) to select their authorized Google identity.

## 8. OAuth Success & Redirect

Upon selecting their account and completing Google authentication, the user is logged into the HimShakti portal and instantly redirected to the protected dashboard.
